

I applaud the NHTSA program for research on ADS vehicles and would like to know what research has done on the vehicles regarding pedestrian warning alarms such as the conventional horn we are so accustomed to now. Somehow the ADS vehicle needs to determine if a cyclist, animal, or other danger exists and give a warning alert to ward off an accident such as car/deer. Some audible system should be on the ADS vehicles especially the electric models as they are so whisper quiet.

Let's be sure our pedestrians, animals and fellow motorists have ample warning. With modern technology this could be a recording, whistle, or what we are familiar with now the horn.

Most importantly would be a warning system that would be implemented at the precise time needed.
