# Comment from Dylan Young

Any accident is terrible, but humans make an absurd amount of poor decisions based on overconfidence, negligence, misprioritization, fatigue, inexperiance or other reasons resulting in thousands of unnecessary deaths every year. I have no problem with a car without a steering wheel/pedals/ect as I believe the computers will be more attentive and engage in many fewer risky situations since it would never be motivated to speed, drink alcohol, showboat, adjust the radio, read a cell phone or any number of behaviors that are currently imparing/distracting drivers today. Testing a few models on the real road has to be part of any QA testing of these vehicles because otherwise you would be testing the entire line on the real road after it is released, which would involve more risk than just testing a few earlier on. Please do everything possible to move toward the self driving car and removing people from the control. SAVE LIVES!
