

Comment from William Mckelvie

The very thought of allowing any vehicle, much less an eighty thousand pound combination vehicle, to go down any roadway, without a human driver, is very questionable in the manner of safety. Even the cars of today come equipped with computer software that demands your hand stay on the wheel. The software itself will display a message that states to put your hands on the wheel if you have remove them while driving. This safety feature was included in a car that I drove most recently. The car came equipped with all the nuances of the newest safety devices. These devices prevent things such as going out of your lane an alert to blind spots as well. With all of the new technology the automobile still demands hands on the wheel while driving. In my honest opinion it is very unsafe to allow any vehicle to go down any roadway without a driver behind the wheel.
