I think gathering of crash data is very important in finding commonalities and similarities about crashes and accidents. Are certain vehicles always involved? During certain times ? Similarities in events....This is what an agency should be doing to help benefit the citizen. There are great technologies out there, some being used by NHTSA, to help automatically analyze this data. By analyzing not only future data, but historical as well, the agency will certainly find great value in this data that can lead to gains and improvements for its Citizens.
