

Comment from John Painter

Yes with caveats like redundancy, independent power (super capacitors?) for 30 seconds or more, cameras with lens covers that sheet water, shed dirt, easily replaceable when scratched, double down on redundancy with stereoscopic cameras and glasses-less 3D displays. Every techno-paranoid concern can be addressed.

Im tall with a short inseam, so I duck down taking right hand curves, like most every on ramp, to see the road ahead the mirror is blocking. My rear views are a pain to adjust properly.

The added sensor fusion with hdr cameras, IR cameras and after-market accessories like radar mapping plus archiving things like accident footage to potholes make it very useful. Headlights wouldnt blind you either with HDR capable cameras, headlights could be inverted to dark spots. And auras could be added to spotted items in the road or near the edge.

Im available to consult if you want to chat on this near future tech.
