

## Comment from Ryan S

I believe camera-based rear visibility systems have the potential to improve driver safety by offering a wider field of view and clearer images of vehicles than current mirror-based vision systems. Furthermore, safety could be improved with the addition of information overlays on the screen to highlight potential dangers, or give additional information. Any shortcomings that camera systems have, such as obstruction by dirt & water, could be dealt with by mandating mechanical cleaning systems, such as rotating wipers, compressed air to blast off water droplets, or any number of other systems which are already in place to clear cameras in harsh environments.
