

Comment from Stephen Cerro

We agree that a seat belt alert system should be implemented for rear seat occupants in school buses and other vehicles. Thus, if a person fails to connect their seat belt safety harnesses, an alarm will notify the driver. The driver can then take measures to enforce their use before proceeding. Everybody will be safer that way. This will work best when occupants cannot defeat the system by connecting the seat belt safety harnesses behind them. Also, grant monies should be made available for public and private schools and school bus contractors for this safety enhancement for all school buses that are in use up through maybe 2030.
