

Comment from Alonzo Barbosa

An LED low watt luminated signal light can be placed above each bench seat on a school bus so that the seat occupant can know that they are being noticed while the driver could easily look back using their rear view mirror to see the illuminated light allowing them to quickly notify the occupants to use their seatbelts verbally using their regular voice or using an on board microphone system. The light would have to be light sensitive so that they would illuminate at a higher brightness during sunny days vs. when students are traveling during evening or at night.

All LED lights would be off when the seatbelts are being used or when properly buckled with no rider in the seat.
