

Comment from Steven Goldman

I am against eliminating rear and side view mirrors. I am not against adding cameras. Why cant we do both?

Eliminating these mirrors would seriously alter drivers habits and possibly cause accidents. People are so use to using mirrors that it would take years for people to try to adjust if they could at all.

Technology may be advantageous. However it is not without risks. If there is a malfunction, what does one do without mirrors?

I have lane departure warning (LDW) in my car. This is a very useful tool. Though it generally works, I have trouble with it due to the fact that the warning light is on the outside rather than the inside of the side view mirror and it is small. The side mirror adds extra safety.

Where are these cameras going to be placed? Do we have to drop our eyes off the road? Will it block our vision at all? Has it been proven to work and are safeguards built in?

Lets not arbitrarily drop something that has worked for decades in favor of some new technology that has not been fully tested

Thank you
