

Comment from Jay Pat

A camera based mirror replacement only makes sense. The obvious benefits being a reduced drag coefficient, less need for mirrors in the current trend towards autonomy, less protrusion from the side of a vehicle and more design choices when designing new state of the art vehicles. Mirror damage is common with a fair number of cars being on the road with broken or missing side mirror glass. Camera based systems will be far less prone to damage, therefore resulting in a safer driving experience. With technology being at a level exceeding what is needed to make cameras and viewing screens a reliable replacement and precedent being set in other country's laws recently, it is time to change this regulation to support the future.
