

## **Comment from Dylan Stinger**

Allowing the use of camera systems is a common sense evolution of current mirror bas3d technology that will allow for further innovation in aerodynamic efficiency without sacrificing safety in vehicles. This is especially important as the nation's vehicle fleet transitions to EVs and efficiency of design is a critical part of determining overall range of electric vehicles. Range anxiety continues to be a major determining factor for customers considering EVs, and allowing manufacturers to further stretch that range with more efficient designs will increase adoption of EVs over internal combustion engines and pushing our economy faster towards making the changes necessary to combat climate change.
