Automating the DRE tests represents the largest opportunity for improvement in process and outcomes. The human conducted nature of the tests leads to inescapable opportunities for inaccuracy, human error, bias, and subjectivity. In a complex and critically important analysis such as the DRE evaluation process, the risks that human conducted tests represent is extremely large and must be proactively addressed. The opportunity for improved outcomes, both in terms of providing data and evidence to the DRE officer, as well as to prevent poor justice outcomes is similarly important. Automating all of some of the DRE testing process will significantly improve the data capture capabilities and therefore outcomes of the process as a whole. Gaize is one such technology that is currently available to DREs. This product automatically conducts the DRE eye tests and captures both high resolution video and data.
